

# DID YOU KNOW?

A typical garden hose can deliver 50 gallons of water in just 5 minutes.

An automated lawn watering system for  $\frac{1}{2}$  acre of lawn delivering 1 inch of water uses 14,000 gallons of water. Although manual overrides are present on almost all systems, many people ignore these and irrigate even if it is raining!

And huge amounts of irrigation water are lost to evaporation in arid climates such as Arizona, southern California, New Mexico, etc.
